Data structures and functions useful for v
The search project should not need anything
"""

class Counter(dict):
    """
    A counter keeps track of counts for a set of keys.

    The counter class is an extension of the standard python
    dictionary type. It is specialized to have number values
    (integers or floats), and includes a handful of additional
    functions to ease the task of counting data. In particular,
    all keys are defaulted to have value 0. Using a dictionary:

    a = {}
    print a['test']

would give an error, while the Counter class analogue:

>>> a = Counter()
>>> print a['test']
0

returns the default 0 value. Note that to reference a key
that you know is contained in the counter,
you can still use the dictionary syntax:

>>> a = Counter()
>>> a['test'] = 2
>>> print a['test']
2

```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

This is very useful for counting things without initializing their counts, see for example:

```
>>> a['blah'] += 1
>>> print a['blah']
1
```

The counter also includes additional functionality useful in implementing the classifiers for this assignment. Two counters can be added, subtracted or multiplied together. See below for details. They can also be normalized and their total count and arg max can be extracted.
